### Select Grade

#### Select

Grade is a subtle feature grade of timber flooring which provides a limited variation in natural characteristics. It has been carefully graded, board by board to ensure that it meets strict quality standards. It has a sleek, uniform look that is well suited to modern, minimalist and traditional styles.

### Standard Grade

#### Standard

Grade is distinguished by highlighting selective gum veins, spirals, burls, insect trails and other natural variations that give timber floors a unique character as individual as a signature. This grade is a visual chronicle of forest history including bush fires, floods, drought, insect travels and the natural variations that appear in the grain of Australian native hardwoods. Standard grade is carefully graded to include the most interesting variations and distinctive timber markings to enhance the look of a timber floor.

### Feature Grade

#### Feature

Grade features a high level of natural characteristics. This grade offers a unique rustic aged appearance with extenuated natural features including gum vein, knots, face checking and insect travels.

### Species hardness (Janka) rating

The Janka rating measures the hardness of the timber.

The higher the number, the harder the timber.

### Species Hardness Rating

- Victorian Ash 4.9
- Tasmanian Oak\* 5.5
- Cypress Pine 6.1

The Janka rating is the average rating for the species used in that blend.
